WIFI 1

WIFI

WIFI is a radio network that is added onto a wired ethernet switch to provide Ethernet function and, most often, access to the Internet. Modern WIFI can be deployed using multiple access points covering a wide physical area using a technology called wireless mesh networking. A deeper explanation of WIFI networking is provided in Appendix 1.

All the systems listed below are business grade, expandable, remote- managed systems produced by well- established companies with good dealer networks across BC.

- Netgear Orbi Pro
- Ubiquiti Unifi
- Dell EMC Ruckus
- Cisco Meraki
- HPE Aruba
- Juniper
